IDEAL-GAS TABLES FOR OBLIQUE-SHOCK FLOW PARAMETERS

IN AIR AT MACH NUMBERS FROM 1.05 TO 12.0

By John S. Dennard and Patricia B. Spencer

SUMMARY

Oblique-shock tables are presented for air with initial Mach numbers from 1.05 to 12.0 and flow-deflection angles from 0° up to the maximum turning angle for attached flow. Parameters presented are flow-deflection angle, shock-wave angle, total-pressure ratio, static-pressure, density, and temperature ratios, downstream Mach number, ratio of downstream velocity to maximum velocity, and increase in entropy. Perfect-gas equations have been used throughout these calculations. The tabulated values of shock angle in tables 503.111 and 503.211 of NAVORD Report 1488 (vol. 2) were used as source data and the computations were thereby simplified considerably.

INTRODUCTION

The determination of the flow conditions existing downstream of a weak oblique shock is often required in the study of supersonic-flow phenomena. The basic equations governing the flow across an oblique wave are well known and have been published in many papers. (See, for instance, refs. 1 to 4.) Several papers have tabulated or plotted these oblique-shock flow parameters (refs. 2, 3, 4, and 5) using Mach number and shock angle as primary parameters. The arrangement of these tables is due to the fact that no convenient explicit relations exist with Mach number and deflection angle as primary parameters. The tables of reference 6 give solutions for several Mach numbers between 3 and 30 at deflection-angle increments of 1° . It is often the case, however, that a supersonic design problem will, at a given initial Mach number, require the solution of the flow conditions downstream of a series of fixed flow deflections which will determine the values of the other parameters. A problem of this type requires tables with closely spaced Mach number increments and an extensive set of flow parameters across the shock. This is particularly true in the design of supersonic inlet diffusers. In such a case it is necessary either to resort to extensive interpolation if existing tables are used or to be content with a lower degree of precision if charts are used. The present tables present Mach number and flow deflection as primary parameters. These parameters together with the shock-wave angle, as tabulated in reference 7, are used to determine the ratios of total pressure, static pressure, density, and temperature, entropy rise, downstream Mach number, and downstream ratio of local velocity to maximum velocity for oblique-shock waves. This paper is essentially a rearrangement and extension of reference 3 and parts of reference 6.

SYMBOLS

M	Mach number
p	static pressure
p_t	total pressure
R	gas constant, 1716 ft ² /sec ² -°R
ΔS	increase in entropy across shock, ft ² /sec ² -°R
T	static temperature
V	velocity
V_m	maximum velocity attainable by expanding to absolute zero temperature
W	ratio of local velocity to maximum velocity
β	acute angle between downstream flow direction and shock wave, $\epsilon - \delta$, deg
γ	ratio of specific heats, 1.40 for air
δ	flow-deflection angle, deg
δ_{\max}	maximum flow-deflection angle for attached flow, deg
ϵ	shock-wave angle, deg
ρ	static density

SHOCK EQUATIONS

The tables of sections 503.111 and 503.211 of reference 7 have provided a convenient starting point for the determination of the flow parameters across an oblique shock. These tables together with the perfect-gas oblique-shock equations found in reference 1 have been used to prepare the present set of oblique-shock tables. Figure 1 shows the relationship between the turning angle δ and the shock-wave angle ϵ . The pertinent equations of reference 1 in the present

COMPUTER PROGRAM

The flow parameters identified in the section "Shock Equations" have been programed for and computed on the IBM 1620 data processing system at the Langley Research Center. A print-out of the program and a flow chart for the program are presented in this section and in figure 2. A discussion of input and output for the program is also included. The program, which is written in FORTRAN language (ref. 8), uses the final forms of the identifying shock equations in computing the parameters. An initial value of 0° is assumed for the turning angle, and increments of either 0.5° or 1° are allowable up to the maximum angle for attached flow. The symbols used for this program are as follows:

AM	M_1
AM2	M_2
DEL	δ
DELMX	δ_{\max}
DELTS	ΔS
EPS	ϵ , deg
K	number of values of δ
L	specifies increment of δ
PREST	$P_{t,2}/P_{t,1}$
RHO	ρ_1/ρ_2
SPE	ϵ , radians
STAT	P_2/P_1
TEMP	T_2/T_1
W	W_2

Description of Program

Input.- The input to the program is of two types. The first type is read into the IBM 1620 data processing system by the FORTRAN statement:

```
      READ 200,AM,DELMX,K,L
      200 FORMAT (2E12.5,I3,I3)
```

If L is 1, the increment is taken as 1° ; if it is 0, the increment is 0.5° . The value of K may not exceed 48. The second type is read into the machine by the FORTRAN statements:

```
      DO191 = 1,K,6
19 READ 20, EPS(I), EPS(I+1), EPS(I+2), EPS(I+3), EPS(I+4), EPS(I+5)
      20 FORMAT (6E12.5)
```

The program takes up to 48 values of ϵ . The input values of δ_{\max} and ϵ are in degrees and are converted to radians within the program.

Output.- For each Mach number the answers are in two groups, with 48 lines of print-out devoted to each group. In printing out the answers, a special band was placed on the printer so that it would give 48 lines per page, and therefore print each of the two groups of answers for a given Mach number on separate pages. The values of δ and ϵ are printed out in degrees. For purposes of reproduction, the two pages of print-out for each Mach number were combined in the present tables.

Complete program.- The following program has been used on the IBM 1620 data processing system at the Langley Research Center.

DISCUSSION OF TABLES

Solutions of equations (1) to (7) are presented in tabular form for Mach numbers from 1.05 to 5 in steps of 0.05 and for Mach numbers from 5 to 12 in steps of 0.1. (See table I.) The flow-deflection angle is varied from $\delta = 0$ to δ_{\max} for attached shock waves in steps of 0.5° from Mach 1.05 to 1.95 and in steps of 1° from Mach 2.0 to 12.0. These increments do not exhaust the source tables of reference 7 for Mach numbers less than 5; however, a simple interpolation should provide satisfactory results for intermediate points throughout table I.

In the Mach number range from 1.05 to 1.95, the tables use increments of 0.5° for δ . These values of δ do not appear in reference 7 and accurate values of ϵ in this range were determined as follows: It was necessary to interpolate in the tables for the values of ϵ corresponding to the $\frac{1}{2}^\circ$ values of δ . To insure accuracy, this interpolated value of ϵ together with values 0.01° larger and smaller were used to compute δ . If the desired value of δ was not bracketed by these computations, ϵ was increased or decreased as necessary until δ was bracketed. The value of ϵ which corresponded most nearly to the desired value of δ was then used for input data. In a few cases, at flow angles near detachment, this same process was used to determine ϵ to the nearest 0.001° .

For each of the Mach numbers considered, the values of δ , ϵ , M_2 , W_2 , $\frac{p_2}{p_1}$, $\frac{\rho_2}{\rho_1}$, $\frac{T_2}{T_1}$, $\frac{p_{t,2}}{p_{t,1}}$, and ΔS are presented in table I. All parameters are presented as five-digit numbers followed by the letter E with a plus or minus sign and two more digits. The five-digit number is not rounded off in the last figure. The "E" notation refers to the exponent of 10 by which the five-digit number must be multiplied in order to place the decimal correctly.

Although the IBM 1620 will compute and read out 8 significant figures, the tables present only 5 figures because of the limitations imposed by the input information. The tables of reference 7 give values of ϵ to only two decimals for all values of δ except δ_{\max} . Calculations were made to determine the maximum possible error that would result from having rounded off ϵ by $\pm 0.005^\circ$. These errors were then used to determine the accuracy which could be guaranteed in the tables. The results are as follows:

M_1	δ , deg	Accuracy in significant figures for tables of -						
		M_2	W_2	$\frac{p_2}{p_1}$	$\frac{\rho_2}{\rho_1}$	$\frac{T_2}{T_1}$	$\frac{p_{t,2}}{p_{t,1}}$	ΔS
2	1	3	3	4	4	4	5	2
2	22	4	4	4	4	4	4	4
12	1	3	3	3	5	4	4	1
12	44	4	3	4	5	4	4	5

It should be noted that the input ϵ will generally not have been rounded off by as much as $\pm 0.005^\circ$ and the tables will be more accurate than this analysis indicates.

These tables do not include real-gas effects and should be used with caution in regions where real-gas effects can cause appreciable deviations from the perfect-gas calculations. A discussion of imperfect-gas effects may be found in reference 1 and the effects of a real gas on oblique-shock waves may be found in references 6, 9, and 10. Effects of varying the specific heat and applications to real-gas flows may be found in reference 11 where similarity parameters were used to correlate many of the oblique-shock flow parameters.

CONCLUDING REMARKS

Oblique-shock tables are presented for air with initial Mach numbers from 1.05 to 12.0 and flow-deflection angles from 0° up to the maximum turning angle for attached flow. Parameters presented are flow-deflection angle, shock-wave angle, total-pressure ratio, static-pressure, density, and temperature ratios, downstream Mach number, ratio of downstream velocity to maximum velocity, and increase in entropy. Perfect-gas equations have been used throughout these calculations.

<p>NASA TN D-2221 National Aeronautics and Space Administration. IDEAL-GAS TABLES FOR OBLIQUE-SHOCK FLOW PARAMETERS IN AIR AT MACH NUMBERS FROM 1.05 TO 12.0. John S. Dennard and Patricia B. Spencer. March 1964. 156p. OTS price, \$3.00. (NASA TECHNICAL NOTE D-2221)</p> <p>Oblique-shock tables are presented for air with initial Mach numbers from 1.05 to 12.0 and flow-deflection angles from 0° up to the maximum turning angle for attached flow. Parameters presented are flow- deflection angle, shock-wave angle, total-pressure ratio, static-pressure, density, and temperature ratios, downstream Mach number, ratio of down- stream velocity to maximum velocity, and increase in entropy. Perfect-gas equations have been used throughout these calculations. The tabulated values of shock angle in tables 503.111 and 503.211 of NAVORD Report 1488 (vol. 2) were used as source data and these computations were thereby simplified considerably.</p>	<p>I.
